Water Purification Equipment makes every effort to provide accurate and complete information in this catalogue, various data such as flow rates, pressure ratings and product information may change without prior notification. All housing and cartridge flow rates are based on optimal conditions. All housings must be protected from water hammer.
Filter housing is constructed of:

- Head and body: Talc filled polypropylene.
- Clear bowl: Styrene Acrylonitrile (San)
- Opaque bowl: Polypropylene
- Gasket: Nitrile, Buna-N
- Colour: White, Blue, Clear

- These housings are suitable for water and a wide range non corrosive liquids.
- Filter housings must be protected against freezing and direct sunlight.
- Maximum operating temperature: 124 degree’s F. (50C)
- Maximum operating pressure: 8 bars
- Clear bowls should not be cleaned with solvents such as acetone etc.

- Mounting brackets for housings is available. (optional)
- Spanners for bowl removal are also available (optional)

- Inlet and outlets
  - 5 inch housing ¼ inch BSP threaded
  - 10 inch housings Inlet and outlets ¼”, ½”, ¾”, 1” BSP threaded.
  - 20 inch housings Inlet and outlets ¾”, 1” BSP threaded.

- Maximum flow rate
  - 5 inch housing 11 LPM
  - 10 inch housing 19 LPM
  - 20 inch housing 38LPM

Talc-filled polypropylenes have improved rigidity, hardness, and heat resistance compared to the base resin. Polypropylene is highly resistant to corrosive materials, organic solvents, and degreasing agents as well as electrolytic attack. Compared to low or high density polyethylene, polypropylene has a lower impact strength, but superior working temperatures and tensile strength.
Filter housing is constructed of:

- Head and body: Talc filled polypropylene.
- Opaque bowl: Polypropylene
- Gasket: Nitrile, Buna-N
- Colour: Blue

- These housings are suitable for water and a wide range of non-corrosive liquids.
- Filter housings must be protected against freezing and direct sunlight.
- Maximum operating temperature: 95 degrees F. (35°C)
- Maximum operating pressure: 6 bars
- Housings must be protected from water hammer.
- Mounting brackets for housings are available (optional).
- Spanners for bowl removal are also available (optional).

- Available inlet and outlets: 1", 1 ½" BSP threaded.
- Maximum flow rate:
  - 10 inch housing: 85 LPM
  - 20 inch housing: 85 LPM

Talc-filled polypropylenes have improved rigidity, hardness, and heat resistance compared to the base resin. Polypropylene is highly resistant to corrosive materials, organic solvents, and degreasing agents as well as electrolytic attack. Compared to low or high density polyethylene, polypropylene has a lower impact strength, but superior working temperatures and tensile strength.
Stainless steel 10-20 inch housing

Filter housing is constructed of:

- Head and body: 304 stainless steel
- These housings are suitable for water and a wide range non corrosive liquid.
- Filter housings must be protected against freezing.
- Maximum operating temperature 194 degree’s F. (90C)
- Maximum operating pressure 10 bars
- Mounting brackets for housings are available. (optional)
- Spanners for bowl removal are also available (optional)
- **Housings must be protected from water hammer.**
- Inlet and outlets
  - 10 inch housings inlet and outlet ½”, ¾” BSP threaded
  - 20 inch housings inlet and outlets ¾” BSP threaded.
  - 10 inch housings large diameter inlet and outlets 1” BSP threaded
  - 20 inch housings large diameter inlet and outlets 1” BSP threaded.
- Maximum flow rate
  - 10 inch housing slim 19 LPM
  - 20 inch housing slim 38 LPM
  - 10 inch housing large diameter 85 LPM
  - 20 inch housing large diameter 85 LPM

Stainless steel housings are mainly used in industrial applications. Were there may be pipe hammer or hydraulic shock from fast opening and closing valves and were units need to be installed in direct sunlight.

304 stainless steel is not recommended for brine or sea water (316 stainless steel must be used for brine or Sea water)
10 inch hot water housing

Filter housing is constructed of:

- Head and body: Glass-Reinforced Nylon
- Opaque bowl: Glass-Reinforced Nylon
- Gasket: Nitrile, Buna-N
- Colour: red

- These housings are suitable for water and a wide range non corrosive liquid.
- Filter housings must be protected against freezing and direct sunlight.
- **Housings must be protected from water hammer.**
- Maximum operating temperature 158 degree’s F. (70°C)
- Maximum operating pressure 8 bars
- Mounting brackets for housings is available. (optional)
- Spanners for bowl removal are also available (optional)
- Available inlet and outlets ¾” BSP threaded.
- Maximum flow rate – 10 inch housing 19 LPM

Used in hot water applications were sediment needs to be removed from water for hot water recycling e.g. Laundromat, Hot water wash bay.

Activated carbon cannot be used in a hot water filter as this will deactivate the carbon and reduce surface area.
Inline 10 inch filter housing / Inline candle filters

Inline filters are generally used where space requirements are an issue e.g., water cooler or the back of a fridge. Can be mounted on plastic quick release brackets for easy filter changes.

- Gasket Buna – N
- Housing body – polypropylene
- ¼ inch inlet and outlet
- Max pressure 8 bars
- Filter cartridges – candle cartridges slim
- Filter media can be loose packed using separator pads
- Different media types - Granular activated carbon, mixed bed resin, Clarofos, KDF, Ceramic
- Filter housing dimensions 315 mm length x 80 mm wide
- Colours available clear and white
- Max flow rate – 11 LPM
- Filter housings must be protected against freezing and direct sunlight.
- **Housings must be protected from water hammer.**

**Candle cartridges**

(Candle ceramic is also available, see ceramic cartridges for specs and details)

- Max flow rates on carbon candle cartridges 4 LPM
- Max flow rates on Polyprop candle cartridges 11 LPM
- Maximum differential pressure - 1 bar

(Max Flow Rate - Carbon absorption capacity will be will drop at maximum flow rates)
Filter housing brackets

Single wall mounting brackets

Slimline housings ¼ inch
¾ inch 1” standard housings
Large diameter (4” housing)

Double brackets

Slimline ¼, ½ inch bracket
¾, 1” inch standard bracket
Large diameter (4” housing)

Triple brackets

Slimline ¼, ½ inch bracket
¾, 1” inch standard bracket
Large diameter (4” housing)

All brackets are available in stainless steel.
(All stainless steel housings are supplied with single brackets)
Polypropylene / String wound filter cartridges

**Poly prop**
Melt blown filter Cartridges, give excellent life and good performance. Made with the latest Technology to prevent tunnel boring and give good performance with dirt holding capacity and good flow.

**String wound**
String wound filter Cartridges, give excellent life and good performance. And give good performance with dirt holding capacity and good flow. String wound filters have been around since the 1930s.

**Specs**
- 100 % polypropylene. (string wound may have a polypropylene inner core for extra strength)
- Minimum - Maximum operating temperature - 41 degree’s F (5C) - 140 degree’s F. (60C)
- Maximum operating differential pressure 1bar
- The Cartridge structures features excellent depth filtration due to good porosity.
- Standard cartridge Outer diameter is 63 mm and inner diameter is 27 mm.
- Large diameter cartridge Outer diameter is 112 mm and inner diameter is 27 mm.
- Polyprop The nominal Pore sizes available in: 0.2, 1, 5, 10, 20, 30, 50µm.
- String wound The nominal Pore sizes available in: 1, 5, 10, 20, 30, 50, 75, 100µm.
- Polyprop Standard Lengths of: 10”, 20”, 30”, and 40” (Other size are available on request)
- String wound Standard Lengths of: 10”, 20” (Other size are available on request)

- Maximum flow rates standard - polypropylene and string wound
  - 10”  19 lpm
  - 20”  38 lpm
  - 30”  40 lpm
  - 40”  40 lpm
- Large diameter flow rate - polypropylene and string wound (Large diameter String wound on request only)
  - 10”  25 lpm
  - 20”  40 lpm
- **WARNING:** Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
Pleated filters may be used to filter liquids or gases with high efficiency. Pleated cartridges are manufactured from a durable polypropylene media. They are resistant to bacterial attack and compatible with a wide range of Chemicals. Ends are immersed in a thermo setting vinyl plastisol. Embedding and sealing each end of the pleat block in this fashion fuses components together to form a unitized end cap and gasket. The overlap seam is conically welded to reduce internal bypass, improving filtration efficiency.

- 100 % polypropylene fibre media.
- Robust dirt holding capacity and long life.
- The high porosity of the media provides higher flow rates and dirt holding capacity, while maintaining extremely low pressure drop.
- Longer filtration runs for fewer change-outs and less maintenance.
- Pleated cartridges can be washed and reused depending on application of filter.
- Minimum temperature 41 degree’s F (5C)
- Maximum operating temperature  140 degree’s F (60C )
- Maximum operating differential pressure 0.8 bar
- Standard cartridge Outer diameter is 63 mm and inner diameter is 27 mm.
- Large diameter cartridge Outer diameter is 112 mm and inner diameter is 27 mm.
- The nominal Pore sizes available in: 1, 5, 10, 20, 30, 50µm.
- Standard Lengths of: 10", 20", 30", and 40" (Other size are available)

- Maximum flow rates
  - 10"  40 lpm
  - 20"  70 lpm
  - 30"  100 lpm
  - 40"  130 lpm

- Large diameter flow rate
  - 10"  40 lpm
  - 20"  70 lpm

- WARNING: Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
Screen filter are used for filtering debris and sediment from water. Normally used as pre filtration for pumps to prevent pump impellor damage.

- Made from polypropylene
- Washable and can be reused.
- Minimum temperature 41 degree’s F (5C)
- Maximum operating temperature 140 degree’s F (60C)
- Maximum operating differential pressure 0.8 bar
- Standard cartridge Outer diameter is 65 mm and inner diameter is 27 mm.
- The nominal Pore sizes available in: 20, 50µm, 100, 250 µm
- Standard Lengths of: 10”, 20”

- Maximum flow rates

  | 10” | 20 lpm |
  | 20” | 40 lpm |

- **WARNING:** Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
Carbon block

- Filter media - bonded power activated carbon
- End caps - polypropylene
- Netting – polyethylene
- Inner/Outer wraps – spun bonded Polypropylene
- Gaskets Buna-N
- High dirt holding capacity extends service life
- Excellent for pre-filtration or pre-treatment in RO applications
- High Chlorine taste and odour reduction
- Minimum temperature 41 degree’s F (5C)
- Maximum operating temperature 140 degree’s F (60C)
- Maximum operating differential pressure 1 bar
- Standard cartridge Outer diameter is 65 mm and inner diameter is 27 mm.
- Large diameter cartridge Outer diameter is 112 mm and inner diameter is 27 mm.
- The nominal Pore sizes available in: 1, 5, 10µm.
- Standard Lengths of: 10", 20", 30", and 40" (Other size are available)
- Maximum flow rates
  - 10"  3.8  lpm
  - 20"  7.6  lpm
  - 30" 11.4  lpm
  - 40" 15.2  lpm
- Large diameter flow rate
  - 10"  14.8  lpm
  - 20" 29.6  lpm
- WARNING: Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
  (Max Flow Rate - Carbon absorption capacity will be will drop at maximum flow rates)
  All carbon filters should be flushed to remove carbon fines before use.
Granular activated carbon filter for maximum contact time between water and carbon. Excellent absorption and odour reducing capabilities.

- Excellent absorption of chlorine and chemicals.
- Water has to pass through the entire length of the cartridge.
- Body of filter and end cap – polypropylene
- A post filter should be installed after a GAC cartridge to prevent fines from entering the filter water.
- Maximum differential pressure - 1 bar
- Standard cartridge Outer diameter is 70 mm and inner diameter is 27 mm.
- Large diameter cartridge Outer diameter is 112 mm and inner diameter is 27 mm.

- Maximum flow rates
  - 10" 9 lpm
  - 20" 15 lpm
  - 30" 21 lpm
  - 40" 27 lpm

- Large diameter flow rate
  - 10" 14 lpm
  - 20" 22 lpm

- WARNING: Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system. (Max Flow Rate - Carbon absorption capacity will be will drop at maximum flow rates)

All carbon filters should be flushed to remove carbon fines before use.
Ceramic water filters are an inexpensive and effective type of water filter, that rely on the small pore size of ceramic material to filter dirt, debris, and bacteria out of water.

- Pore size of 0.9 micron
- Low flow rates
- Removes algae, rust, sediment, suspended solids
- Reduces the following harmful bacteria by a rate better than 99.99%
  - E.coli, Cholera,
- Ideally suited for applications where mains pressure is low or gravity filter application.
- Max pressure (6 bar)
- Maximum differential pressure - 1 bar
- Can be cleaned by hand with an abrasive material e.g. Pot scourer, sand paper
- Depending on incoming water quality ceramic flow can vary

Flow rate - dimensions

- 10 inch ceramic cartridge - 2 LPM
  Dimensions - 250mm x 65 mm

- 10 inch candle cartridge
  (One end threaded)
  Dimensions - 2 LPM

- Mineral pot dome ceramic
  (One end threaded)
  Dimensions - Gravity feed only

**WARNING:** Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
Empty cartridges

Empty filter cartridges can be filled with any filtration media of your choice.

Flow rates are dependent on the media inside of the cartridge.

- Made from polypropylene.
- Gasket Buna –N
- Maximum differential pressure - 1 bar
- Standard cartridge Outer diameter is 70 mm and inner diameter is 27 mm.
- Large diameter cartridge Outer diameter is 112 mm and inner diameter is 27 mm.

- Clear Cartridge sizes
  - 10” clear
  - 20” clear

- Opaque cartridges
  - 10” Cap colours – blue yellow white
  - 20” white

- Large diameter cartridges
  - 10” white
  - 20” white

**WARNING:** Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
Linear cartridges

These cartridges are commonly known as polishing filters. These are generally used after your main filtration to clean up minute trace of containments, odours or to inject minerals.

- Made from polypropylene.
- ¼ inch inlet and outlet
- Max temp 52 degrees
- Max pressure 8 bar
- Dimensions
  - Standard cartridge: 250mm x 50mm
  - Large Cartridge: 280mm x 60mm

Linear carbon filter - This filter contains granular activated carbon. Generally used for Reverse osmosis as the final polishing filter for taste and odour removal.

  - Standard cartridge: flow rate - 1.8 LPM (approx 5000 litres)
  - Large Cartridge: flow rate - 2.8 LPM (approx 10000 litres)

Mineral replacement filter - Mineral cartridge is used after the reverse osmosis or deionised process to re-introduce beneficial minerals into the water e.g. calcium and magnesium

  - Standard cartridge: flow rate - 1.8 LPM

Bio ceramic filter - Activates water molecules resulting in more alkaline water, balancing the ph of the water.

  - Standard cartridge: flow rate - 1.8 LPM

Polyprop filter – Used to remove sediment particles down to 5 micron

  - Large Cartridge: flow rate - 2.8 LPM

**WARNING:** Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.

(Max Flow Rate: Carbon absorption capacity will be will drop at maximum flow rates)

- All carbon filters should be flushed to remove carbon fines before use.

pg. 17
Ultra filters are used to remove fine sediment and bacteria from water. Ultra filtration cartridge removes particles of 0.2 µm (micron) or larger. Water filtered using ultra filtration is cleaner than water filtered using micro filtration or ceramic filtration. Ultra filtration cartridge is very durable and has a greater water output.

There should always be a Polyprop sediment filter installed before an ultra filter:

- Pore size 0.2 micron
- Max temperature 38 degrees
- Min temperature 5 degrees
- Max pressure 4 bar
- Unlike reverse osmosis which strips natural minerals that are healthy to human body from the water and makes the water more acidic, ultra filtration membrane retains healthy minerals in water and does not change the pH of water.
- The outside of an ultra filter can be washed of debris and reused. Acid can also be used to dissolve away the debris if the ultra filter still remains blocked.
- Membrane characteristics: Hydrophilic Double Skin
- Hollow-fibre membrane material: Polyacrylonitrile (PAN) Modified
- Chlorine resistant
- Depending on incoming water quality, ultra filter flow can vary

Should not be used where feed water contains iron.

- Maximum flow rates - dimensions
  - 10” 5 LPM (no outer casing)
    (Can be used in a small RO membrane housing)
  - 10” 5 LPM (cartridge type)
  - 20” 10 LPM (cartridge type)
- Standard cartridge: Outer diameter is 63 mm and inner diameter is 27 mm.
KDF-GRANULAR ACTIVATED CARBON CARTRIDGES

KDF/GAC cartridges contain a granular zinc copper alloy (KDF55) which removes impurities from water by exchanging electrons with them in a redox (oxidation/reduction) reaction. In addition to chlorine, this highly efficient, long lasting, recyclable medium also controls microorganisms and removes heavy soluble metals.

- The KDF55 medium is separated by a filter pad within the cartridge from coconut shell-based granular activated carbon which is highly effective at reducing certain organic chemicals such as EDB, TCE, and THM’s in addition to reducing chlorine. A fine pre and post filter screen is incorporated to reduce carbon fines and other suspended particles.
- However, flushing of these cartridges is necessary to remove remaining carbon fines. Cartridges are engineered to allow water to enter one end and pass through the entire bed of KDF/carbon before exiting through the other end, ensuring maximum absorption.
- The use of the KDF55 medium ahead of the granular activated carbon in this cartridge removes more than 95% of the chlorine in your water before it reaches the carbon. This preserves the carbon’s capacity, freeing the carbon to remove organic contaminants more efficiently and extending the carbon’s service life up to 15 times.
- KDF55 media also removes heavy metals and dissolved organic content.
- The body and end caps of this cartridge are constructed of polypropylene.
- Gasket Buna-n.
- The maximum operating temperature of the cartridge is 52 deg. C.
- Standard cartridge Outer diameter is 70 mm and inner diameter is 27 mm.
- Large diameter cartridge Outer diameter is 112 mm and inner diameter is 27 mm.

- Maximum flow rates
  - 10” 9 LPM
  - 20” 15 LPM

- Large diameter flow rates
  - 10” 14 LPM
  - 20” 22 LPM

All carbon filters should be flushed to remove carbon fines before use. (Max Flow Rate - Carbon absorption capacity will be will drop at maximum flow rates)

- WARNING: Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
Reverse Osmosis units are available in many different configurations and sizes depending on your requirements. Units start from 50 gallons a day (GPD) and up.

Common reverse osmosis sizes (All flow rates are maximum flow rates @ 15% recovery per membrane@ 25 degrees):

- 50 GPD
- 100 GPD
- 200 GPD
- 300 GPD
- 400 GPD
- 600 GPD
- 1500 GPD
- 3000 GPD
- 4500 GPD
- 6000 GPD
- 12000 GPD
- 18000 GPD

- Mild and Stainless steel frames are available from 1500 GPD and up.
- Different configurations will give different recovery rates from 15%-60%
- Fibre housings are available for brackish water applications.

UNDER COUNTER / COUNTER TOP

Domestic Filters singles doubles and triples. There are multiple setups and cartridges available for different applications. These filters come with their own water mains connections, tubing, faucet, spanner, fittings for DIY installation. (With exception of the ½ ¾ and 1 inch housings which are normally plumbed inline)
Stage 1 / Pre-filter - At the first stage, the raw water enters a 10 micron pre-filter cartridge to remove any heavy sediment. Then, the raw water enters the distribution tube and travels through the distribution basket.

Stage 2 / Main Filter Tank - From here, water is dispersed through the KDF media which removes inorganic contaminants such as lead and other heavy metals, chlorine a function which carbon alone cannot do.

Stage 3 / Main Filter Tank - In the third stage, chlorine, volatile organic chemicals (VOC's) such as THM's bad tastes and odours, are removed by adsorption into the bed of granular activated carbon (GAC). These granules form a maze of torturous paths through which the water flows. These serve as “parking spaces” for the contaminants.

Stage 4 / Post-filter - Finally, the filtered water exits the main chamber and passes through a 5 micron post-filter which catches any carbon fines that might leave the unit upon initial flush. Clean, fresh water is then ready to use throughout your entire home!

Dual Media - Point of Entry System features. Media is a combination KDF 55 with other medias and is unparalleled in Chlorine removal and heavy metal reduction. Consisting of a high purity copper-zinc formula, it's an NSF approved media that drastically extends the life of a carbon based filter. It is 100% recyclable and has no chemical additives.

KDF 55 Media is used in chlorine removal applications in conjunction with granular activated carbon. KDF 55 strips the chlorine from the water before the water contacts the carbon. The carbon, not being burdened with the job of chlorine removal is then free to perform higher level carbon filtration. Such as removal of chemical contaminants including Volatile Organic Chemical (VOC’s) and Trihalomethanes (THM’s). Using KDF media in conjunction with granular activated carbon extends the life of the media bed significantly over using carbon alone. That means longer service runs before replacement of the media is required.

Point-of-Entry (P.O.E.) - Fresh, filtered water from every tap in your home. Shower in chlorine-free water. Makes all beverages enjoyable and taste natural. Eliminates the need to carry home or bring in bottled water. Plus, whole house water filter systems help to prolong the life of plumbing components and fixtures.
**FIBRE WRAPPED POLYETHYLENE CYLINDER**

**Material of construction**

**Fibre Wrapped Multi-Media Vessels**

Fibre wrapped vessels are used for filtering water with multiple different types of media.

- They give excellent bed depth.
- Give good flow rates and contact time with media.
- Can be loaded with many different types of media. E.g. (sand, carbon, resin, garnet, bio balls)
- Can be fitted with an automatic, manual backwash valve or in/out valve.
- The media can be backwashed or regenerated depending on valve configuration.
- Can easily be backwashed. Backwash can also be automated.
- Maximum pressure rating 10 bars
- Can have multiple layers of media in one vessel.
Dissolved calcium and magnesium precipitate out of hard water as scale, which builds up on the insides of pipes, water heaters, kettles, coffee makers and industrial machinery. Scale reduces flow through pipes and is a poor conductor of heat. Eventually, pipes can become completely clogged.

Hard water reduces soap’s ability to lather, whether in the shower, sink, dishwasher or washing machine, and reacts with soap to form a sticky scum.

Water softeners remain the least costly and most effective way to rid your water of troublesome minerals.

Water softeners operate on a simple principle: Calcium and magnesium ions in the water switch places with more desirable ions, usually sodium. The exchange eliminates both of the problems of hard water because sodium doesn’t precipitate out in pipes or react badly with soap. The amount of sodium this process adds to your water is quite small -- less than 12.5 milligrams per 237 milliliter glass.

Water softeners come in many different sizes. A water softener takes about 1 hour to do a complete backwash cycle. The backwash cycle is normally programmed for 2 am in the morning.

Salt (NaCl) is used in the backwash cycle to backwash and exchange minerals for Sodium. The salt is kept in a brine tank which the water softener will draw out of the brine tank for the regeneration process.

To correctly size a water softener you will need the hardness level of the water measured in PPM and the amount of water you need in 24 hours.
BROMINE / CHEMICAL FEEDER

Brominator with a super acid/alkali-resistant FRP inner liner is suitable for treatment of water with solid biocides or other corrosive water chemicals, efficient and easy-operation. Continuous filament wound FRP makes the vessels more durable. Multiple sizes are available on request.

Materials
- Inner liner: Acid/Alkali- resistant FR
- Opening available: See the table

Operation Parameters
- Max. Operation pressure: 0.4MPa (4.0 BAR)
- Max. Temperature: 40°C (104°F)
- Bottom inlet and drain connection.
- Top opening with threaded, gasket closure.

DISC FILTERS

Product Overview:
The manual disc filter consists of core, shell and valve body. The core includes discs of particular precision and internal ABS support. During filtration, the discs are pressed tightly when water flows by, so foreign materials are blocked outside the discs or in the grooves. When the pressure drops up to a certain value, the disc filter needs to be cleaned. Open the disc filter, loosen and clean discs, finally reassemble.

Technical Parameters:
- Water pressure: 0.15—0.6MPa
- Water temperature: 5°C-50°C
- Media PH value: 4-13
- Inlet/Outlet: 1” - 2” male
- Drain: 1/2-3/4 male
- Water capacity m3/h: 6m3/h to 20m3/h
- Filtration accuracy: 150 (μm)
- With low operation cost, long life and reliable service.
- Good performance and corrosion resistance.
FILTER MEDIA

We keep a variety of different filter media.

SOLENOID VALVES

- Valve sizes ½, ¾, 1, 1.5, 2inch
- -5 degrees to 80 degrees
- Maximum coil temperature 90 degrees
- 220 volts (splash proof cover and gland)
- Naturally open and naturally closed valves are available
STAINLESS STEEL & PVC BAG FILTER HOUSINGS

Bag filter systems are designed for high flow rates and high sediment holding capacity. The filter liquid enters through the top of the bag and is filtered from the inside to the outside of the bag. This reverse filtration allows bigger sediment particles to settle in the base of the bag. While smaller sediment particles filter through the side walls extending the life of the filter bag. The filter bags are locked in place with a locking ring and pressure is applied to the locking ring with a wing nut for a tight seal to prevent bypass. Bag filters allow for quick bag filter changes to keep down time to a minimum. There are also two pressure gauge entry’s so the pressure differential can be monitored for optimal bag usage and replacement. Different types of filter bags are available for specific filter application. Bag filters have multiple uses for filtering large volumes of low and high viscosity fluids. A Bag filter consists of three parts, filter housing (including lid), internal stainless steel mesh basket and filter bag. The stainless steel mesh bag support basket allows for a greater differential pressure drop between inside and outside of the filter bag and helps support the bag as well as prevents filter bag damage.

Features & Benefits:
- Easy to operate & low maintenance
- Low pressure drop
- Low down time between filter bag replacement
- Quick lock flange to avoid bypassing
- Suitable for PP Collar, Rigid Ring
- Large-area, heavy-duty baskets (300 micron)
- All lids and mesh baskets are O-Ring sealed
- All housings made from SS 316 L, SS 316 & SS 304

Housings are electro-polished or bead blasted both inside and outside to prevent dirt and scale build up. Quick opening lid – swing bolt design (larger bag filters have swivel arm design for easy maintenance) Maximum operating pressure stainless steel 10 bar (150 PSI) - 6 BAR PVC (88 PSI)

STAINLESS STEEL - SINGLE BAG FILTERS

(316 stainless bag filters are available on request)

FILTER BAGS

- Filter bags are used in application of high flow rates.
- Filter bags are commonly made from 2 materials polypropylene or polyester.
- Polyester is sewn together. (also known as needle felt)
- Polypropylene is spun bond. (Melted together)
- Polyester - Polypropylene are ideal for water, acids, corrosive chemicals, food products, and more.
- Filter bags have a stainless ring or crush seal. This helps prevents bypass. The crush seal is all used for chemical compatibility were the stainless ring would be corroded.
- Filter bags can be used at temperatures up to 200F.
- Filter bags have their outside surface singed or glazed to prevent fibres’ from the bag getting into the permeate water line.
- Polypropylene filter bags provide depth filtration.
- Polypropylene construction provides strength, and durability.
- Filter bags are available from 1 to 200 micron.
- Filter bags are available in multiple lengths, diameters and custom sizes.
- Filter bags are of welded construction to prevent bypass by sewing material.
- Filter bags can be disposed of by incineration.

(There are certain chemicals that are not compatible with bag filters please check before implementing bag filters with any chemicals)
### WATER PUMPS

Other models and sizes are available on request

**Flow controller (220 volt)**

- Automatically starts pump when pressure drops.
- Maintains pressure at 3 bars. Has a pressure gauge to monitor pressure and Reset button.
- 32mm inlet and outlet
MULTISTAGE PUMPS

Reverse Osmosis Main pump (220 volt)

1.1 KW, 1.5 KW, 2.2 KW

2.0 cubic meters per hour @ 14 bar pressure
2900 rpm

We keep a full range of spares for this pump

Multistage wet end
CDFL2

Spare wet ends are kept in stock

2.0 cubic meters per hour @ 14 bar pressure
2900 rpm

EDI

EDI is a revolutionary water treatment technology, it is skilfully combined electro osmosis technology with ion exchange technology, which doesn’t need acid base regeneration can produce sustainable high quality water. The emergence of EDI is a milestone in water treatment industry entering green environmental protection era. Using EDI technology to produce ultra pure water is a new trend!

- Uv ballast 11 watt to 55 watt
- Uv ballast 110 watt to 440 watt
PRESSURE GAUGES

Stainless steel pressure gauges 10bar, 15bar, 21bar, and 30bar
Bottom entry and rear entry (panel mount)
¼ inch inlet

PRESSURE REDUCING VALVES

Inlet outlet ¼, 3/8, ½, ¾, 1, 1 ½ inch.
Adjustable from 2 bar to 8 bar
Operating pressure 2 bar to 16 bar
Has a ¼ inlet for a pressure gauge to monitor pressure.
(Gauge can be left in place or removed once regulator has been set)

Ultra Filtration is a water purifying system using innovative ‘hollow fibres’ to separate impurities from water. It is capable of removing particles effectively down to 0.01 micron and reach a typical drinking water turbidity value of 0.1 NTU. Ultra Filtration’ is a separation process which has a good separation range about 0.01 to 0.1 micron (Nearly 99.99% of impurities in the water have been separated out in this process).

Compare to the separation range down to 0.001 micron (or RO), Ultra Filtration process do not need a pressure pump/ electric power to operate, does not have wasted water when permeate water is generated, but has high flux volume and easy to maintain. 

Water minerals are not filtered out in the ultra filtration process.

Once the sediment begins to block the cartridge a manual valve or automatic valve can be placed on the opposite end to flush the Ultra filter unit.

Models available
- 4000 lph Stainless steel size 4040
- Ultra filter cartridges can be removed and replaced,
- Ultra filter cartridges can be backwashed with a acid solution to remove lodged sediment.
